Out[8]: parameters    (11, 0.1)
        rmse_value      1.89051
        Name: 30, dtype: object

time: 5.58 ms
```

The best solution is for b= 11 and sigma = 0.1 with rmse value of 1.89051.

This approach comapring to homework 1 gives lower rmse, therefore we got a more accurate result using Gaussian Process. We can also have confidence intervals for predictions if we calculate covaraince.

However, Gaussian Procecss is computationally more expensive comparing to ridge and polynomial regression specially with large data. therefore there is an issue of scaling. Also it doesnt have a closed form
